

DATA STRUCTURE

Roll No. : F031	Name: Panvir Rao
Class : SYIT	Batch : 2
Date of Assignment : 25/6/26	Date/Time of Submission : 25/6/26

Practical 1

Array Operations:

Write a program to implement basic array operations:

a. Insert an element at a specific position in an array.

code:

```
array=[1,2,3,4,5,6,7]

pos = int(input("Enter your index: "))
ele = int(input("Enter your element: "))

array.insert(pos,ele)

print(array)
print("Panvir s031")
```

output:

```
=====
Enter your index: 3
Enter your element: 14
[1, 2, 3, 14, 4, 5, 6, 7]
Panvir s031
```

b. Delete an element from a specific position in an array. Code:

```
datastructurepy.py - D:/datastructurepy.py (3.14.6)
File Edit Format Run Options Window Help

array=[1,2,3,4,5,6,7]

eledel = int(input("Enter your index to delete: "))
array.pop(eledel)
print(array)
print("Panvir, 31")
```

Output:

```
=====
Enter your index to delete: 5
[1, 2, 3, 4, 5, 7]
Panvir, 31
|
```

c. Search for an element in an array (linear search).

code:

```
array=[1,2,3,4,5,6,7]
num = int(input("enter element : "))
flag = 1

for i in array:
    if i==num:
        flag = 0
        break

if flag==0:
    print("enter found")
else:
    print("element not found")
print("panvir, S031")
```

output:

```
Enter your index to delete: 5
[1, 2, 3, 4, 5, 7]
Panvir, 31

=====
enter element : 5
enter found
panvir, S031
```
